PODIS[®] Plus

Dispense with confidence with PODIS

Set up sophisticated real-time dispense alerts

The sophisticated alerts in PODIS Plus provide an invaluable failsafe for you and your practice, by helping ensure dispenses are correct and reduce potential financial risk.

Built to respond to your practice's needs, the key alerts in PODIS Plus include:

Patient alert

Indicates if a Patient Assistance Program patient is accidentally being dispensed a billable dose, and vice versa.

Diagnosis alert

Indicates if a dose is being dispensed for a diagnosis code that the patient's insurance might not cover.

Drug expiration alert

Indicates if a dose is expired, and also indicates if a dose is being dispensed when there are other doses closer to their expiration dates.

Minimum interval alert

Set an alert warning for when the same drug – or same kind of drug – is being dispensed within a certain period. This is to protect against reimbursement being denied due to certain insurers' rules regarding frequency of treatment.

With PODIS Plus, inventory management is easier, payment verification more accurate, and your practice can finally unlock its true potential.
